Assessment	
4 Programming assignments	
HW1: Assigned 19/10, due 26/10 (5%) HW2: Assigned 27/10, due 7/11 (20%)	
HW3: Assigned 10/11, due 21/11 (20%)	
HW4: Assigned 24/11, due 1/12 (15%)	
1 Programming Project (40%)	
Assigned 2/12, due 15/12	
Submitting HW2 commits you to the course	
Imperial College	

Main topics

- · Version control with git and bitbucket
 - Background on version control
 - Working locally on your computer
 - Moving material back and forth from the cloud

Imperial College

Software version control

- Originally used for large projects with many developers
- · Now a standard tool in software engineering
- Slowly becoming a standard tool in scientific computing

Imperial College

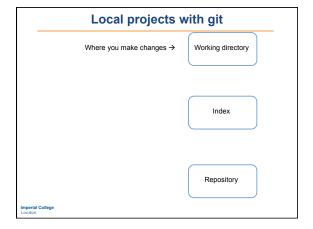

Software version control

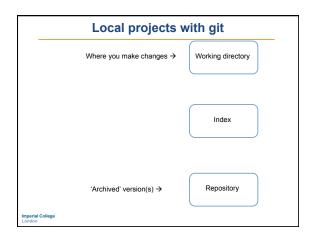

- Originally used for large projects with many developers
- · Now a standard tool in software engineering
- Slowly becoming a standard tool in scientific computing
- · Useful for:
 - Collaboratively developing software
 - Keeping track of changes to code
 - Managing different versions of code in an organized manner
- The more complicated the problem, the more important it is to use version control!

	Local version control
	• SVN
	Was standard tool 5-10 years ago, now losing popularity
	Uses client-server model Master version and history stored centrally on server
	What happens if server is down?
	• Git
	Rapidly gaining popularityUses distributed model
	Software history stored locally in .git subdirectory
ondor	al College n
	Local projects
	Good programming practice:
	1. Make a plan/outline
	2. Take notes and add comments
	3. Careful testing and validation
mperio	al College
ondo:	n
	Local projects
	Good programming practice:
	1. Make a plan/outline
	2. Take notes and add comments
	3. Careful testing and validation
	Git helps with 2. and 3.
	Sit noips with 2. and 0.

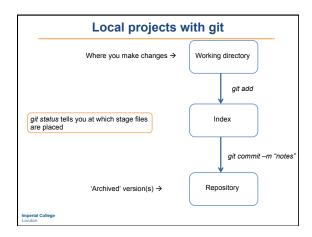

Example: Creating a local git repository	
Imperial College London	
Initialize	
1st step: make directory and initialize as a repo:	
<pre>\$ mkdir git_example</pre>	
<pre>\$ cd git_example</pre>	-
<pre>\$ git init Initialized empty Git repository in /Users/prasun/Documents/ repos/git_example/.git/</pre>	
\$ ls -a	
git	
History of changes will be stored in hidden directory .git	
Imparial College	
Imperial College London	
Create file, add and commit	
 Open text editor and make file, scientists.txt Check status 	
\$ cat scientists.txt Issac Newton Albert Einstein	
\$ git status On branch master	
Initial commit	
Untracked files: (use "git add <file>" to include in what will be committed)</file>	
scientists.txt	
nothing added to commit but untracked files present (use "git	

Create file, add and commit
Note: git tells you what to do next
cat scientists.txt ssac Newton lbert Einstein
git status n branch master
nitial commit
ntracked files: (use "git add <file>" to include in what will be committed)</file>
scientists.txt
othing added to commit but untracked files present (use "git dd" to track)
nperial College ondon
Create file, add and commit
Create file, add and commit 3. Add file to index
3. Add file to index \$ git add scientists.txt \$ git status
3. Add file to index \$ git add scientists.txt \$ git status On branch master
3. Add file to index \$ git add scientists.txt \$ git status On branch master Initial commit Changes to be committed:
3. Add file to index \$ git add scientists.txt \$ git status On branch master Initial commit Changes to be committed: (use "git rm —-cached <file>" to unstage)</file>
3. Add file to index \$ git add scientists.txt \$ git status On branch master Initial commit Changes to be committed: (use "git rm —-cached <file>" to unstage)</file>
3. Add file to index \$ git add scientists.txt \$ git status On branch master Initial commit Changes to be committed: (use "git rm —-cached <file>" to unstage)</file>

Create file, add and commit

4. Commit file to repository

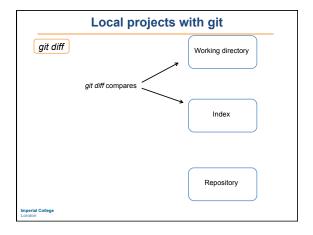

\$ git commit -m "initial commit, scientists.txt added to repo"
scientists.txt
[master (root-commit) 6e74cfc] initial commit, scientists.txt
added to repo
Committer: Prasun Ray

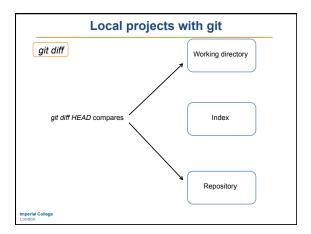

1 file changed, 2 insertions(+) create mode 100644 scientists.txt

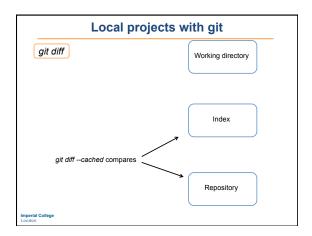

Now try git status:

\$ git status
On branch master
nothing to commit, working directory clean

Imperial College London

diff example

Make change to scientists.txt and compare to "official" version

\$ cat scientists.txt
Issac Newton
Albert Einstein
Galileo Galilei \$ git diff HEAD diff --git a/scientists.txt b/scientists.txt index 9079fe8..efc1584 100644 --- a/scientists.txt +++ b/scientists.txt Issac Newton Albert Einstein +Galileo Galilei

Visiting previous versions

- git log provides project history

\$ git log
commit aa47da5b74ab89a7929100d62679c2c5b81b2674
Author: Prasun Ray <p.ray@imperial.ac.uk>
Date: Sun Oct 4 14:49:13 2015 +0100

added Galileo

commit 6e74cfc8cf12191558751e610d80b76cb321a58c
Author: Prasun Ray rasun@Prasuns-Air.home>
Date: Sun Oct 4 14:34:22 2015 +0100

initial commit, scientists.txt added to repo

Visiting previous versions

- git log provides project history
- git checkout lets you examine previous versions
- git checkout master returns to current version

\$ git checkout 6e74cfc8c Note: checking out '6e74cfc8c'.

You are in 'detached HEAD' state. You can look around, make experimental changes and commit them, and you can discard any commits you make in this state without impacting any branches by performing another checkout.

If you want to create a new branch to retain commits you create, you may do so (now or later) by using -b with the checkout command again. Example:

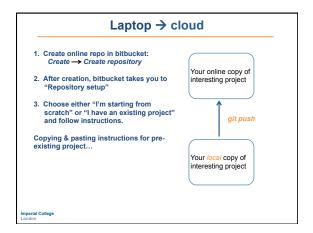

git checkout -b new_branch_name

HEAD is now at 6e74cfc... initial commit, scientists.txt added to repo

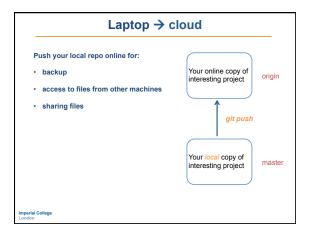

\$ cat scientists.txt Issac Newton Albert Einstein

List of commands (so far): (git add commit status diff log checkout

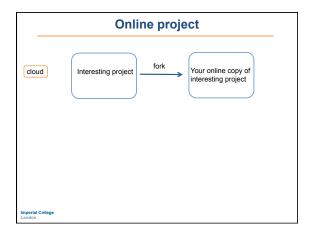

List of commands (so far): git add commit status diff log checkout Getting help: git add --help or git log --help

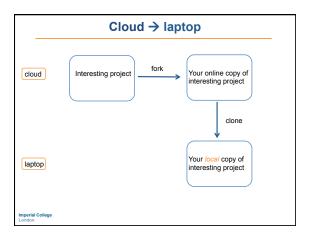

Laptop → cloud \$ git remote add origin https://ImperialHPSC@bitbucket.org/ ImperialHPSC/git-example.git \$ git push -u origin --all # pushes up the repo and its refs for the first time Counting objects: 6, done. Delta compression using up to 4 threads. Compressing objects: 100% (2/2), done. Writing objects: 100% (2/2), done. Writing objects: 100% (6/6), 531 bytes | 0 bytes/s, done. Total 6 (delta 0), reused 0 (delta 0) To https://ImperialHPSC@bitbucket.org/ImperialHPSC/git-example.git * [new branch] master -> master Branch master set up to track remote branch master from origin. \$ git push -u origin --tags # pushes up any tags Everything up-to-date Online repo is named origin and the local repo is pushed to origin mmoral College London.

Online projects We've seen how to make local projects and push them online But how do we work on projects that are already online? Will need to fork and then clone the project

Online projects: Example

2. Use git clone to make local copy of your fork:

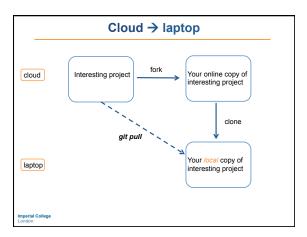

\$ git clone https://username@bitbucket.org/username/gitexample-2.git Cloning into 'git-example-2'... remote: Counting objects: 3, done. remote: Total 3 (delta 0), reused 0 (delta 0) Unpacking objects: 100% (3/3), done. Checking connectivity... done. \$ cd git-example-2/ \$ ls mathematicians.txt

Now you have your own copy to play with!

Note: If the original repo is updated, bitbucket will tell you and give you the option of syncing your fork

or, you can directly pull the updated original repo to your local repo...

Imperial College

Cloud → laptop

Procedure: pull from online repo to local branch 1st, specify online repo:

 $git\ remote\ add\ IHPSC\ https://username@bitbucket.org/ImperialHPSC/git-example-2.git$

Here IHPSC is the online repo name

Imperial College

Cloud → laptop Procedure: pull from online repo to local branch 1st, specify online repo: git remote add IHPSC https://usemame@bitbucket.org/ImperialHPSC/git-example-2.git Here IHPSC is the online repo name Check which local branch you want to use: git branch tells you which branch you are on git branch → a lists all branches git checkout branch_name switches to branch_name Imperial College London Cloud → laptop

Cloud → laptop

Procedure: pull from online repo to local branch

1st, specify online repo:

git remote add IHPSC https://username@bitbucket.org/ImperialHPSC/git-example-2.git

Here IHPSC is the online repo name

Check which local branch you want to use:

git branch tells you which branch you are on

git branch → a lists all branches

git checkout branch_name switches to branch_name

For example,

git pull IHPSC master

will pull from the IHPSC online repo to your local master branch

Finally, push your local repo to your fork:

Loodon git push origin master
